

Prevent SNAP QC errors before adjudication

A reusable case-coherence platform, grounded in state policy, operational workflows and customer systems.

SNAP first • Medicaid • Child care • TANF

APPLICATION

INTERVIEW

EVIDENCE

SOR ENTRY

POLICY + DECISION

The product reviews every eligibility and QC touchpoint

Journey stage	What happens	Product touchpoint	QC review	Product output
1 Policy setup	Federal/state rules, waivers, dates	Policy baseline	Right version and option	Configured rule set
2 Application	Facts, filing date, signature, documents	Application reader	Completeness and contradictions	Structured facts + gaps
3 Worker triage	Case type, clocks, expedited screen	Triage reviewer	Required next action	Risk-led checklist
4 Interview	Questions, answers, unresolved facts	Interview reviewer	Coverage and consistency	Missing follow-ups
5 Verification	Documents, collateral, data matches	Evidence checker	Sufficiency and conflicts	Evidence-to-fact map
6 SOR entry	Household, income, deductions, codes	Field comparator	Source fact vs keyed value	Mismatch flags
7 Adjudication	Tests, allotment, proration, period	Policy checker	Independent policy trace	Expected outcome
8 Notice + issue	Action, reason, date, benefit, EBT	Action reviewer	Decision and notice alignment	Authorization flags
9 Changes + recert	Reports, matches, adverse action	Continuing review	Timeliness and ongoing eligibility	Change-action flags
10 Formal QC	Sample, field review, variance, cause	QC workbench	Payment impact and error source	Reviewer-ready finding
11 Corrective	Patterns, training, system fixes	Analytics + learning	Recurring root causes	Targeted improvement

APPLICATION FACTS → INTERVIEW FACTS → EVIDENCE FACTS → SOR ENTRIES → POLICY + FINAL DECISION

Evidence must connect across the state technology environment

A reusable core supports state-specific delivery

Product logic remains reusable; policy, mappings and access are configured for each state and customer.

DD&I requires complementary people and skills

PRODUCT OWNER

Leadership + product	Executive sponsor • Product lead • UX/product designer
Architecture + engineering	Solutions architect • Software engineers • AI/ML engineers • Data/integration engineer
Cloud + assurance	DevSecOps engineer • Security/compliance lead • QA/evaluation analyst
Program expertise	Federal SNAP-policy SME • Eligibility/QC SME
Delivery + contracts	Implementation specialist • Product/privacy/security/IP legal support

PARTNER

Leadership + coordination	Executive sponsor • Program manager • Product/co-design lead
State + case expertise	State-policy SME • Eligibility/QC SME • Workers • Supervisors • QC reviewers
Systems + assurance	SOR analyst/integration counterpart • Security/compliance lead
Delivery + adoption	Implementation/training lead • Customer-success lead
Market + contracts	Sales/account lead • Proposal/procurement lead • Prime/subcontract legal support

Partner validation is operational product work—not an informal contribution—and must be planned, staffed and governed.

M&O and future upgrades need continuing ownership

M&O — Product owner

- Hosting, environments, monitoring, logs and backups
- AI/OCR operations and release management
- Product defects, security patches and vulnerabilities
- Federal policy monitoring and connector maintenance
- Evaluation, regression and second-line support
- Incident, privacy and security response

M&O — Partner

- First-line support, adoption and customer success
- State policy/procedure maintenance and training
- Prime reporting and customer-security reporting
- Account management, renewals and onsite governance
- Customer/subcontract administration
- Insurance and contractual obligations

Future upgrades — Product owner

- General platform and AI capabilities
- Additional SOR and system connectors
- Security, scale and reusable policy improvements
- New worker, supervisor and QC functions
- Medicaid, child care, TANF and other programs

Future upgrades — Partner

- Use-case and market identification
- Customer demand, workflow and policy validation
- Representative cases, acceptance and pilot access
- Training, implementation and commercialization
- Delivery and support feedback

Classify before build: reusable • partner-specific • customer-specific • security/compliance • new program

The cost structure spans build, operations and expansion

One-time / implementation

- Discovery, workflow, UX and product design
- Initial software, AI/ML and QC engine
- Federal model + first-state configuration
- Initial SOR adapter, mapping and vendor work
- Case corpus, evaluation and acceptance testing
- Pilot deployment, training and change
- GovCloud architecture and environments
- Security controls, StateRAMP readiness and initial pen test
- Privacy/data-use, IP, contracting and procurement
- Travel, insurance/bonding and external integration fees

Recurring operations

- Cloud environments, storage and backups
- AI inference, OCR, logging and observability
- Security tooling, monitoring, tests and assessments
- Federal/state policy and connector maintenance
- Product releases, defects and evaluation regression
- First-line and second-line support
- Customer success, training and change
- Prime reporting, renewals and account expansion
- Legal, privacy, security, insurance and third-party software
- US-based access, secure devices, incident response and continuity

Upgrade / expansion

- New state configuration
- New SOR or surrounding-system integration
- New program policy model
- Customer-specific enhancements
- New security or authorization obligations
- Higher support or SLA coverage
- Additional environments and volume
- Sponsored roadmap acceleration

Customer coordination, policy work, procurement and prime-contract management are real project costs for the partner.

A balanced structure lets both companies keep investing

Layered ownership

- We own the reusable platform, architecture, policy framework, common integrations and generalized enhancements
- Partner owns pre-existing methods, brand, relationships and independent delivery assets
- Customer/state data remains customer-controlled
- Customer-specific deliverables are classified individually
- Both receive the licenses needed for their agreed roles
- Both retain independent development outside protected opportunities

Durable economic advantage

- We compound platform, usage, M&O and reusable-product value
- Partner compounds account, prime-contract, implementation, training and support value
- Partner-funded reusable work earns commercial credits—not automatic core-IP ownership
- Opportunity protection is specific, time-bound and performance-based
- Work-made-for-hire or assignment is a separately evaluated exception

DECISIONS TO MAKE TOGETHER

01

Pilot customer, state +
case scope

02

DD&I, M&O, support +
prime roles

03

One-time + recurring
cost responsibility

04

Opportunity + account
economics

05

Customer IP, data,
security + continuity

The goal: preserve freedom to invest while making each party's value, work and risk economically durable.
